## SUSTAINABLE PLANET EARTH: ECOLOGICAL DIMENSIONS AND STRATEGIES

### INTRODUCTION

The need to preserve natural environment of planet earth recognized by earth scientists, or various human societies since long back as we generally supposed. Classical writers, Plato were, referring even in the fourth century B. C. to the permanent role of forests in the regulation of water cycle and protection of soil against erosion. However, the great variety of motives which led to past civilization to take protective measures were often very different from the modern world, although that has been prevented some forests, water bodies and animal species for enjoying effective protection for centuries even in some cases for more than a thousand years. However, no matter how important these early attempts at conservation may have been, it is essential to realize that their effectiveness was relatively limited and they sprang from ideas very different from those which have recently given such a decided boost to the protection of natural resources.

These recent moves have arisen from the fact there has been an exponential growth in the degradation of biosphere and devastation of entire ecosystem since the dawn of the modern era. It is high time to speak strongly against the Man made progress on the cost of Nature that is our life sustainer.

The past few decades have witnessed a growing awareness of the effects of human activities on natural resources of our planet. In recent years, environmental pollution has evolved a multi-disciplinary field of research to examine the impact of environmental degradation on natural environment as well as to propose policies and strategies towards sustainable planet Earth.

The conference would provide an ideal platform for the scholars from different parts of India and abroad to present and exchange their research findings and ideas. The organizers wish to extend cordial invitation to all concerned scholars to participate in this prestigious event.
